DiL
Data-driven Intelligence & Learning Lab

Maximum A Posteriori

- Given - Dataset of N independent observations D

Maximum A Posteriori

- Given - Dataset of N independent observations D

- ML estimate - w that maximizes the data likelihood

$$\mathbf{w}_{ML} = \underset{w}{\arg\max}\ p(D|w)$$

Maximum A Posteriori

- Given - Dataset of N independent observations D $= \{x_1, x_2 \ldots x_N\}$

- MAP estimate - choose most probable **w** given data

Maximum A Posteriori

- Given - Dataset of N independent observations D

- MAP estimate - choose most probable w given data

$$\mathbf{w}_{MAP} = \arg\max_{w} \; p(w/D)$$

MAP - Curve Fitting

- Given data D $D = \{(x_1, t_1), (x_2, t_2), \ldots (x_N, t_N)\} = \{\mathbf{x}, \mathbf{t}\}$

MAP - Curve Fitting

- Given data D $D = \{(x_1, t_1), (x_2, t_2), \ldots (x_N, t_N)\} = \{\mathbf{x}, \mathbf{t}\}$

- Model $p(t|x, \mathbf{w}, \beta) = \mathcal{N}(t|y(x, \mathbf{w}), \beta^{-1}) = \sqrt{\frac{\beta}{2\pi}} e^{-\frac{\beta}{2}[t - y(x,w)]^2}$

MAP - Curve Fitting

$P(w|D)$

- Given data D $D = \{(x_1, t_1), (x_2, t_2), \ldots (x_N, t_N)\} = \{\mathbf{x}, \mathbf{t}\}$

- Model $p(t|x, \mathbf{w}, \beta) = \mathcal{N}(t|y(x, \mathbf{w}), \beta^{-1})$

$$\mathbf{w}_{MAP} = \arg\max_{\mathbf{w}} \; p(\mathbf{w}|\mathbf{x}, \mathbf{t}, \beta)$$

भारतीय सांकेतिक विज्ञान संस्थ हैदराबाद
भारतीय प्रौद्योगिकी संस्थान हैदराबाद
Indian Institute of Technology Hyderabad

DiL
Data-driven Intelligence & Learning Lab

MAP - Curve Fitting

$P(w|D) \propto P(D|w)P(w)$

- Given data D $D = \{(x_1, t_1), (x_2, t_2), \ldots (x_N, t_N)\} = \{\mathbf{x}, \mathbf{t}\}$
- Model $p(t|x, \mathbf{w}, \beta) = \mathcal{N}(t|y(x, \mathbf{w}), \beta^{-1})$

$$\mathbf{w}_{MAP} = \arg\max_{\mathbf{w}} \; p(\mathbf{w}|\mathbf{x}, \mathbf{t}, \beta)$$

Given a prior $P(w|\alpha)$ the posterior distribution becomes

$$p(\mathbf{w}|\mathbf{x}, \mathbf{t}, \beta, \alpha) = \frac{P(t|w, x, \beta)\, P(w|\alpha)}{P(t|x, \beta, \alpha)}$$

$$\propto P(t|x, w, \beta)\, P(w|\alpha)$$

भारतीय प्रौद्योगिकी संस्थान हैदराबाद
Indian Institute of Technology Hyderabad

DiL
Data-driven Intelligence & Learning Lab

MAP - Curve Fitting

- MAP estimate - for convenience apply log

$$\mathbf{w}_{MAP} = \underset{w}{\operatorname{argmax}} \left[\log p(t|x,w,\beta) + \log p(w|\alpha) - \log p(t|x,\beta,\alpha) \right]$$

independent of w

MAP - Curve Fitting

- Assuming Gaussian Prior and independence on parameters $\mathbf{w} \in \mathbb{R}^{\mathbf{M}}$

$$p(\mathbf{w}|\alpha) = \prod_{\mathbf{i=1}}^{\mathbf{M}} \mathcal{N}(\mathbf{w_i}|\mathbf{0}, \alpha^{-1})$$

$w_i \sim \mathcal{N}(0, \alpha^{-1})$

$i = \{1, 2 .. m\}$

$$= \prod_{i=1}^{m} \sqrt{\frac{\alpha}{2\pi}} e^{-\frac{\alpha}{2} w_i^2} = \left(\frac{\alpha}{2\pi}\right)^{m/2} \prod_{i=1}^{m} e^{-\frac{\alpha}{2} w_i^2}$$

$$= \left(\frac{\alpha}{2\pi}\right)^{m/2} e^{-\frac{\alpha}{2} \sum_{i=1}^{m} w_i^2} = \left(\frac{\alpha}{2\pi}\right)^{m/2} e^{-\frac{\alpha}{2} w^T w}$$

MAP - Curve Fitting

$$\mathbf{w}_{\mathbf{MAP}} = \arg\min -\log \mathbf{p}(\mathbf{w}|\mathbf{x}, \mathbf{t}, \beta, \alpha) = \arg\min -\log \mathbf{p}(\mathbf{t}|\mathbf{x}, \mathbf{w}, \beta) - \log \mathbf{p}(\mathbf{w}|\alpha)$$

$$= \arg\min_{w} \; -\log p(t|x,w,\beta) - \log\left(\left(\frac{\alpha}{2\pi}\right)^{m/2} e^{-\frac{\alpha}{2}w^T w}\right)$$

$$= \arg\min_{w} \; -\log p(t|x,w,\beta) - \frac{m}{2}\log\frac{\alpha}{2\pi} + \frac{\alpha}{2} w^T w$$

$$p(t|x,w,\beta) = \prod_{i=1}^{N} \sqrt{\frac{\beta}{2\pi}}\, e^{-\frac{\beta}{2}\left[t_i - y(x_i,w)\right]^2}$$

Independent of w

$$w_{MAP} = \arg\min_{w} \left\{ \frac{\beta}{2} \sum_{i=1}^{N} \left[t_i - y(x_i,w)\right]^2 + \frac{\alpha}{2} w^T w \right\}$$

MAP - Curve Fitting

- Predictive distribution

$$p(t|x, \mathbf{w}_{MAP}, \beta) = \mathcal{N}(t|y(\mathbf{w}_{MAP}, x), \beta)$$

$\mathbf{w}_{ML}^*$ $\mathbf{w}_{MAP}^*$

Bayesian Prediction

So far

- Our estimates for **w** have been point estimates
  - ML and MAP

So far

- Our estimates for **w** have been point estimates
  - ML and MAP
  - Regarded as frequentist because they discard ‘uncertainty’ about the **w**

Fully Bayesian

- An approach that relies on consistent application of sum and product rules of probability at all levels of modeling

Fully Bayesian

- Given a prior belief $p(\mathbf{w}|\alpha)$ over w, and data D

Fully Bayesian

- Given a prior belief $p(\mathbf{w}|\alpha)$ over w, and data D
- We are interested in the posterior

$$p(\mathbf{w}|\mathbf{D}) = \frac{P(D|w)\ P(w)}{P(D)}$$

Fully Bayesian

- The predictive distribution becomes

$$p(x'|D) = \int p(x', w|D)\, dw = \int p(x'|w, D)\, p(w|D)\, dw$$

Fully Bayesian

- Curve fitting example

Fully Bayesian

- Curve fitting example
- Given training data (**x**, **t**)

Fully Bayesian

- Curve fitting example
- Given training data (**x**, **t**) and a test sample x

Fully Bayesian

- Curve fitting example
- Given training data (**x**, **t**) and a test sample x
- Goal - predict the value of t

Fully Bayesian

- Curve fitting example
- Given training data (**x**, **t**) and a test sample x
- Goal - predict the value of t

We wish to evaluate the predictive distribution $p(t|x, \mathbf{x}, \mathbf{t})$

Fully Bayesian

$$p(t|x, \mathbf{x}, \mathbf{t}) = \int p(t|x, \mathbf{w}) p(\mathbf{w}|\mathbf{x}, \mathbf{t}) \, d\mathbf{w}.$$

$w \sim N(0, \alpha)$

$$= \int p(t, w | x, \underline{x}, \underline{t}) \, dw$$

$$= \int p(t | x, \underline{x}, \underline{t}, w) \; p(w | x, \underline{x}, \underline{t}) \, dw$$

$$= \int p(t | x, w) \; p(w | \underline{x}, \underline{t}) \, dw$$

Fully Bayesian

- Advantages
  - Inclusion of the prior knowledge
  - Represents uncertainty in t' due to the target noise and uncertainty over **w**

Fully Bayesian

- Advantages
  - Inclusion of the prior knowledge
  - Represents uncertainty in t' due to the target noise and uncertainty over **w**
- Disadvantages
  - Posterior is hard to compute analytically
  - Prior is often a mathematical convenience
